Disclosures

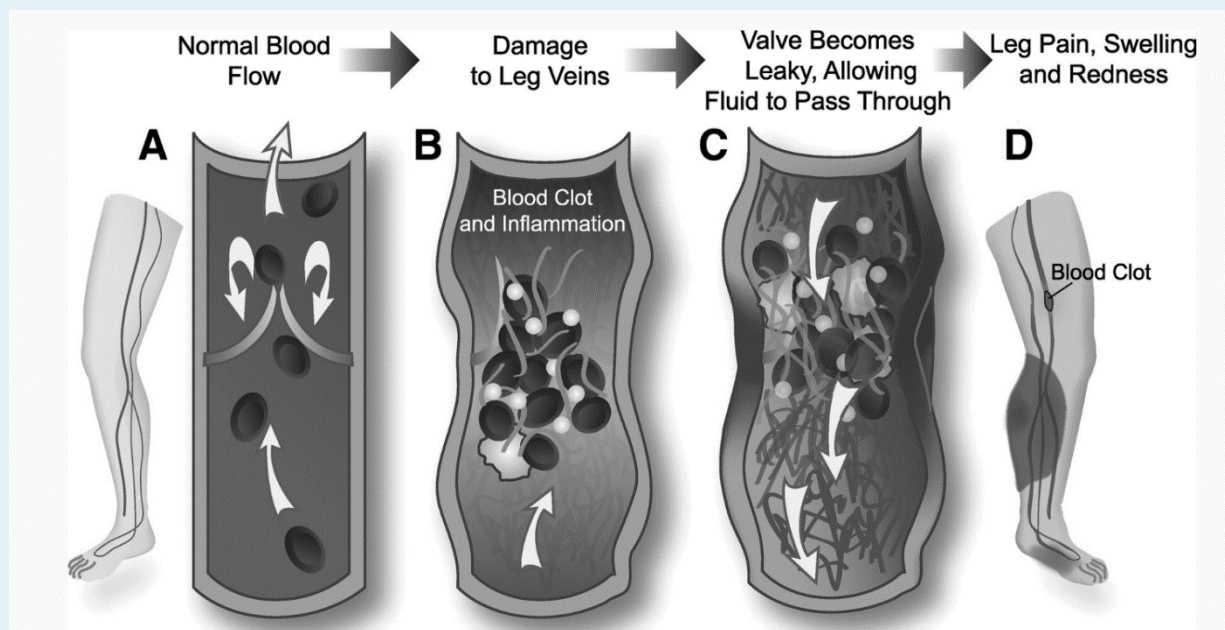

- I have the following financial relationships to report with ACCME-defined ineligible companies.

Name of Company	Nature of Relationship	Current Status
Inari	Consultant	Active
Mercator	Consultant	Active
Penumbra	Consultant	Active

- I will be discussing investigational uses of dexamethasone sodium phosphate, injection, and the use of experimental deep venous valves during this presentation.

Why treat DVT?

- Early return of vein patency
- Preserve valvular function to limit long term complication
- Prevent pulmonary embolism
- Limit Post-thrombotic syndrome

	Cumulative incidence		Survival rate
	Recurrent DVT	Post-thrombotic syndrome	
2 years	17%	25%	80%
5 years	24%	30%	74%
8 years	30%	30%	69%

Heparin vs. Thrombolysis

Comparison of 13 studies

Outcome	Heparin	Thrombolysis
	N=254	N=337
Complete Lysis	4%	45%
Partial Lysis	14%	18%
No Change/Worse	82%	37%

Comerota A, Aldridge S. *Semin Vasc Surg.* 1992;5(2):76-81.

Sequelae of DVT

- Post-thrombotic syndrome may result in:
 - Chronic pain
 - Swelling
 - Skin ulceration secondary to post-phlebotic syndrome
- Chronic condition in 30-75% of DVT patients within 2 years
 - 90% unable to work due to leg symptoms 10 years after iliofemoral DVT
- Irreversible damage to veins & valves
 - **Impact on quality of life**

Postthrombotic syndrome

Postthrombotic pigmentation

Healed skin ulcer and postthrombotic pigmentation

Chronic (left) leg swelling, skin hardening, and postthrombotic pigmentation

Post-Thrombotic Syndrome

- PTS develops in 29% to 74% of patients following DVT
- Affects 5% of US population
- 400,000 to 500,000 individuals have venous stasis ulcers
- Annual direct cost of PTS in the US of \$200 million
- 2 million workdays lost annually in the US

Greater thrombus removal gives lower PTS rate

Comerota et al. J Vasc Surg. 2012 Mar;55(3):768-73.

Journal of Vascular Surgery®

Postthrombotic morbidity correlates with residual thrombus following catheter-directed thrombolysis for iliofemoral deep vein thrombosis

Anthony J. Comerota, MD,^a Nina Grewal, MD,^a Jorge Trabal Martinez, MD,^a John Tahao Chen, PhD,^b Robert DiSalle, MD,^a Linda Andrews, RN,^a Deb Sepanski, RT(R),^a and Zakaria Assi, MD,^a Toledo and Bowling Green, Ohio

Background: Iliofemoral deep vein thrombosis (DVT) is associated with severe postthrombotic morbidity when treated

Study to evaluate correlation between residual thrombus and post-thrombotic syndrome (PTS)

- 71 consecutive IFDVT patients treated with CDT
- Blinded comparison of pre- and post-treatment phlebograms and evaluation of CEAP/Villalta scores

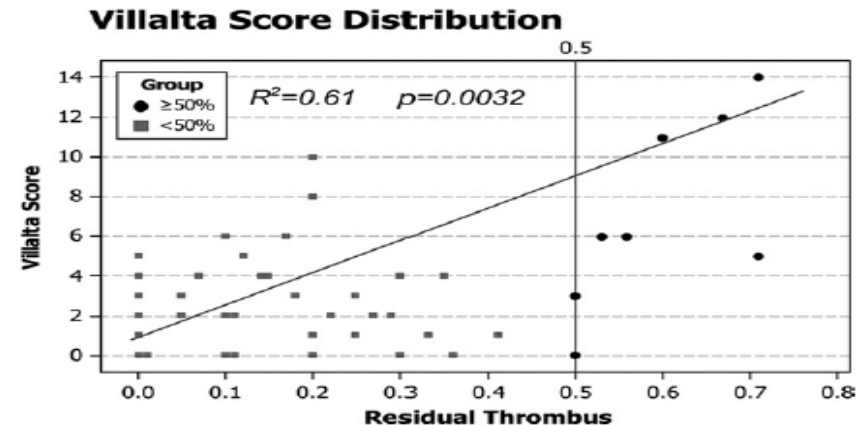

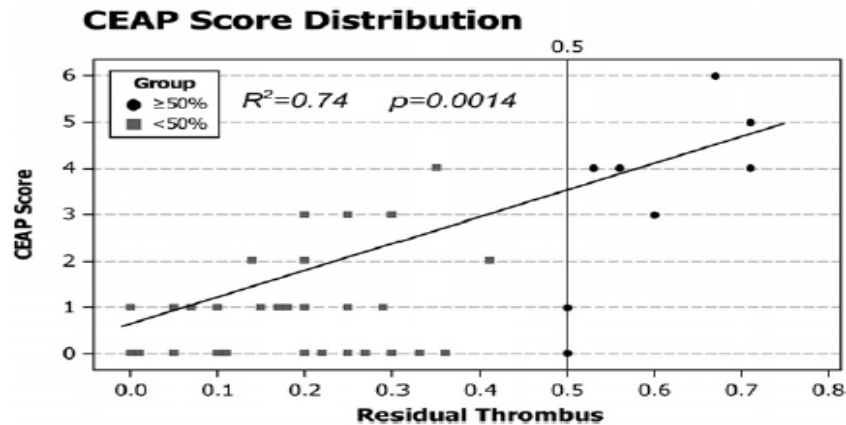

correlation of clinical class of CEAP with residual thrombus ($R^2 = .74$; $P = .004$) and a direct linear correlation of Villalta score with residual thrombus ($R^2 = .61$; $P = .0014$).

Conclusion: In patients with iliofemoral DVT treated with catheter-based techniques of thrombus removal, postthrombotic morbidity is related to residual thrombus. When thrombus clearance was complete, the postthrombotic syndrome was avoided. Residual thrombus is associated with an increasing risk of postthrombotic syndrome. (J Vasc Surg 2012;55:768-73.)

Greater thrombus removal gives lower PTS rate

Comerota et al. J Vasc Surg. 2012 Mar;55(3):768-73.

Journal of
Vascular Surgery®

First study to demonstrate:

- **Direct** and **significant** correlation of between PTS scores and thrombus clearance
- Conclusion: when thrombus clearance is complete, PTS can be avoided

Villalta Score

<i>Symptoms/clinical signs</i>	<i>None</i>	<i>Mild</i>	<i>Moderate</i>	<i>Severe</i>
Symptoms				
Pain	0 points	1 point	2 points	3 points
Cramps	0 points	1 point	2 points	3 points
Heaviness	0 points	1 point	2 points	3 points
Paresthesia	0 points	1 point	2 points	3 points
Pruritus	0 points	1 point	2 points	3 points
Clinical signs				
Pretibial edema	0 points	1 point	2 points	3 points
Skin induration	0 points	1 point	2 points	3 points
Hyperpigmentation	0 points	1 point	2 points	3 points
Redness	0 points	1 point	2 points	3 points
Venous ectasia	0 points	1 point	2 points	3 points
Pain on calf compression	0 points	1 point	2 points	3 points
Venous ulcer	Absent			Present

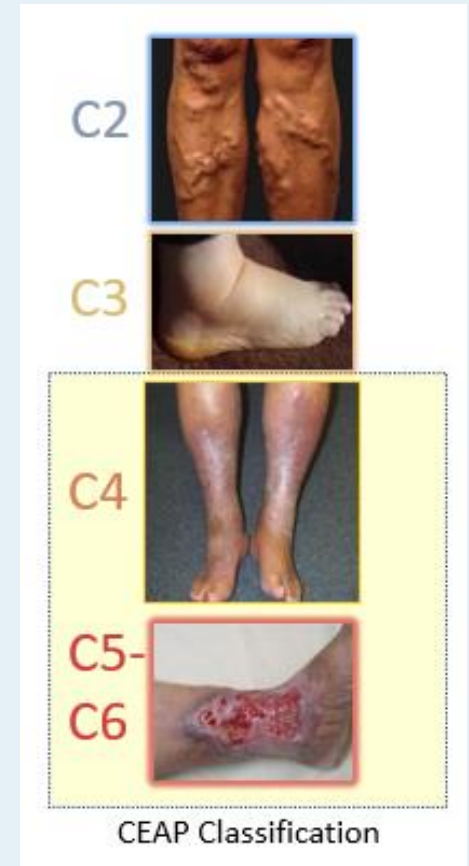

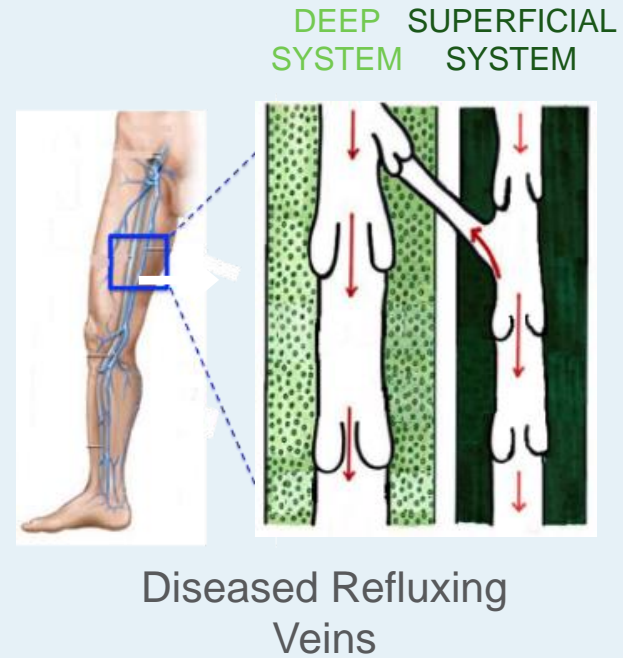

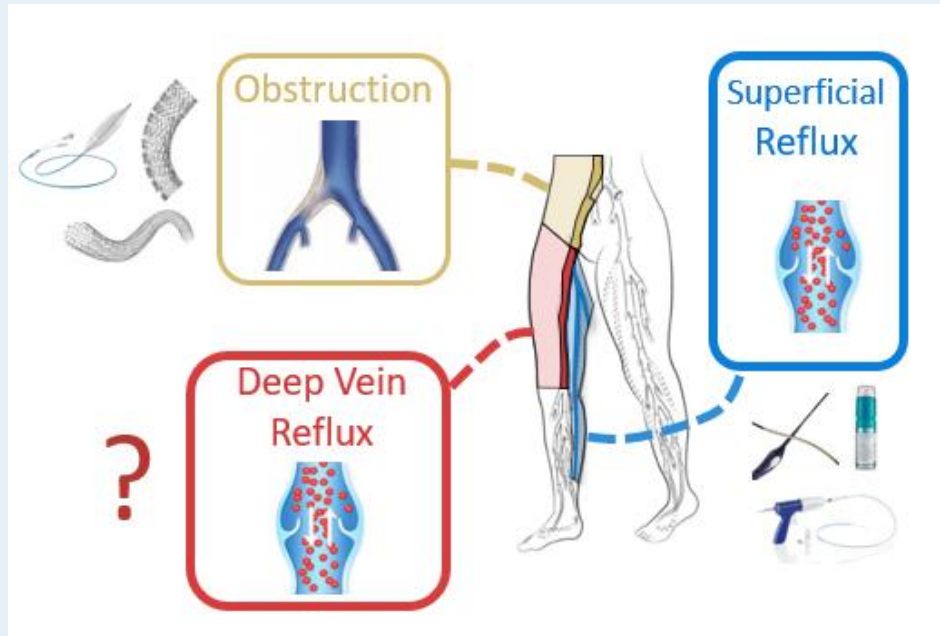

VISUAL GUIDE FOR THE ASSESSMENT OF POST-THROMBOTIC SYNDROME

No or Minimal	Mild	Moderate	Severe
Edema  <p>0</p>	 <p>1</p>	 <p>2</p>	 <p>3</p>
Hyperpigmentation  <p>0</p>	 <p>1</p>	 <p>2</p>	 <p>3</p>
Venous ectasia  <p>0</p>	 <p>1</p>	 <p>2</p>	 <p>3</p>
Redness  <p>0</p>	 <p>1</p>	 <p>2</p>	 <p>3</p>
Skin induration Skin of shin and ankle not thickened and loosely mobile over underlying tissue or bony structures.	Skin of shin and ankle slightly thickened or slightly adherent to underlying tissue or bony structures.	Skin of shin and ankle moderately thickened or moderately adherent to underlying tissue or bony structures.	Skin of shin and ankle very thickened or highly adherent to underlying tissue or bony structures.
Pain during calf compression None.	Present, patient rates pain as mild to moderate.	Present, patient rates pain as moderate to severe.	Present, patient rates pain as severe to intolerable.
Ulcer Scored as present (i.e. any ulcer) or absent. Ulcer is typically located on medial aspect of lower leg and may be open or healed.			

Notes:
 Signs may be less apparent in patients with brown or black skin.

Three Major Underlying Causes of Symptoms of *Post-Thrombotic Syndrome*

‘CVI’ refers to *severe Venous Disease* (CEAP 4-6), where mixed etiologies are common including Deep Vein Reflux (DVR), Superficial Reflux, and Venous Obstruction. The most prevalent and progressive is *post thrombotic* after DVT

Post-Thrombotic Syndrome (PTS): Valve Destruction & Obstruction

The post thrombotic syndrome: Ignore it and it will come back to bite you

Collagen scarring, trabeculae damage valves and cause obstruction

CVI CEAP Score Progression

Most DVT Treatment Has Inadequate Outcomes

Isolated Iliac ± common fem: thrombectomy, stenting (ideal IDE cases)

– **20-30% Loss of Stent Patency at 3 years**

Isolated tibial and/or popliteal: Oral anticoagulants

Iliofemoral: Thrombectomy, iliac stenting, ill defined inflow

– **PTS rates of 44% (18% moderate-severe) in first 2 years¹**

Femoral: ATTRACT- intervention not supported by risk-benefit

– **PTS rates of 41% (17% moderate-severe) in first 2 years²**

1. Comerota et al. *Circulation*. 2019;139:1162.

2. Kearon et al. *Thromb Haemost* 2019;119:633.

Anatomical data from 1,338 patients in **De Maeseneer, et al.** *Eur J Vasc Endovasc Surg* (2016) 51:415-420

Why are Outcomes Inadequate?

- Current DVT therapies are limited to methods of clearing thrombus to provide an acute outcome
- Post thrombotic syndrome (PTS) remains a long-term outcome in 30-50% of patients, regardless of thrombus clearance method
- Current PTS therapies include...
 - Anticoagulation
 - Compression stockings
 - Encourage ambulation
 - PTA/Stenting of residual obstruction
 - Access PTS Trial utilizing TPA with adjunctive PTA/Stenting
- Preventing PTS requires addressing the underlying causes (inflammatory hypothesis?)
 - Chronic vein wall changes/fibrosis
 - Damaged/dysfunctional valve

Inflammation is Critical in DVT Formation and Resolution

Mosevoll, et al. *Front. Med* 5:147.

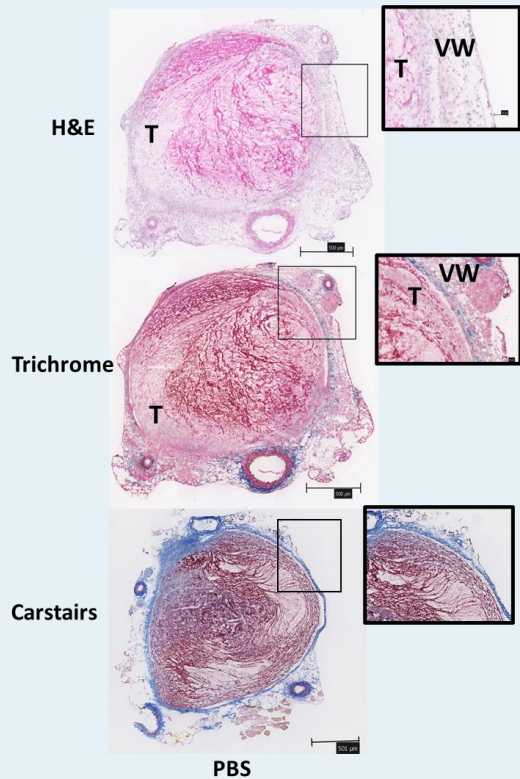

“Resolution of inflammation and acceleration of this process is believed to be beneficial for restoring vein wall patency and reducing the pathology associated with PTS.”

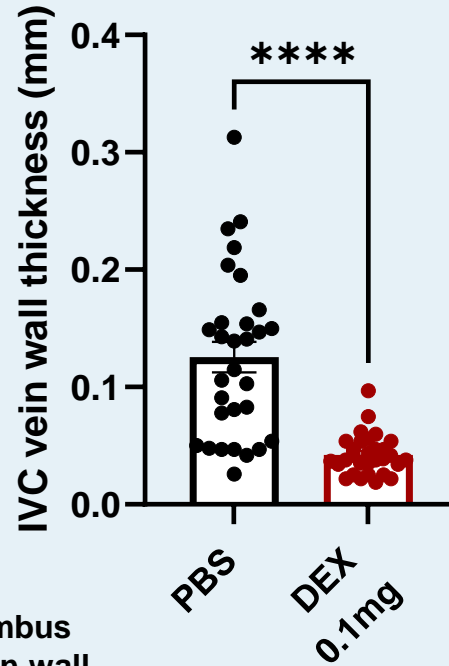

Preclinical Mouse Studies with Dexamethasone

PBS Control

DEX

T = thrombus
VW = vein wall

Reduced IVC wall thickness by 70%

PBS

DEX 0.1mg

Average collagen thickness with DEX approaches normal IVC

****p<0.0001.

Reducing DVT Inflammation post-Recanalization with Targeted Dexamethasone Delivery

Workflow:

1. Open the lumen
2. Treat the vein
3. Stent as needed

Bullfrog® Micro-Infusion Device

DEXTERITY-AFP Trial Design

DEXTERITY-AFP: Perivenous **DEX**amethasone Therapy: **E**xamining **R**eduction of Inflammation after **T**hrombus Removal to **Y**ield Benefit in Acute Femoropopliteal (AFP) DVT

Global co-PIs: David Dexter and Mahmood Razavi

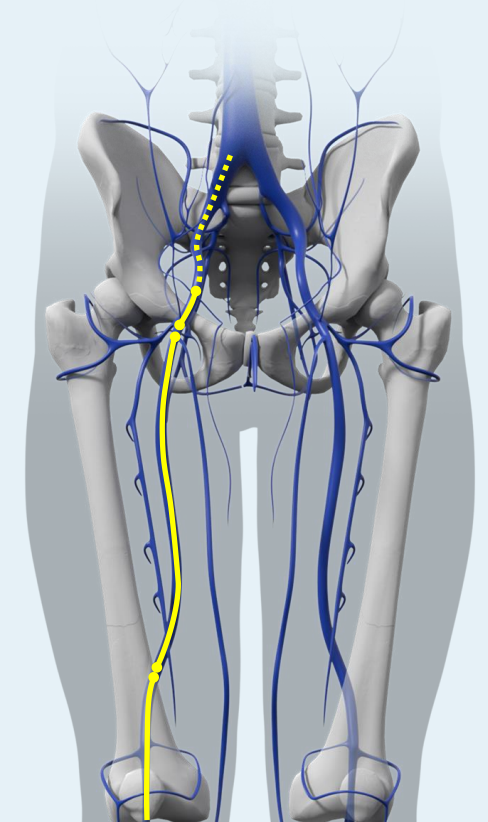

Principal Inclusion Criteria: 0-14 days post symptom onset, involvement of common femoral, femoral, or popliteal veins

Open-Label Phase:

(followed by) **Dual-blind RCT:**

Follow-up Months:

DEXTERITY-AFP First 13 Participants

Participant Characteristic	N (%) or Mean \pm S.D.
Enrolled prior to 12/31/2022	13 (100%)
Withdrawn after 1 mo f/u	1 (7.7%)
Age	55 \pm 16
Male gender at birth	10 (76.9%)
Left side DVT	10 (76.9%)
Days post symptom onset	8.9 \pm 4.2
BMI	29.7 \pm 3.9
Office BP	136 \pm 17 / 80 \pm 10
Follow-up	N (%) or Mean \pm S.D.
Months of follow-up	9.6 \pm 4.3
Drug- or device-related SAE	0 (0%)

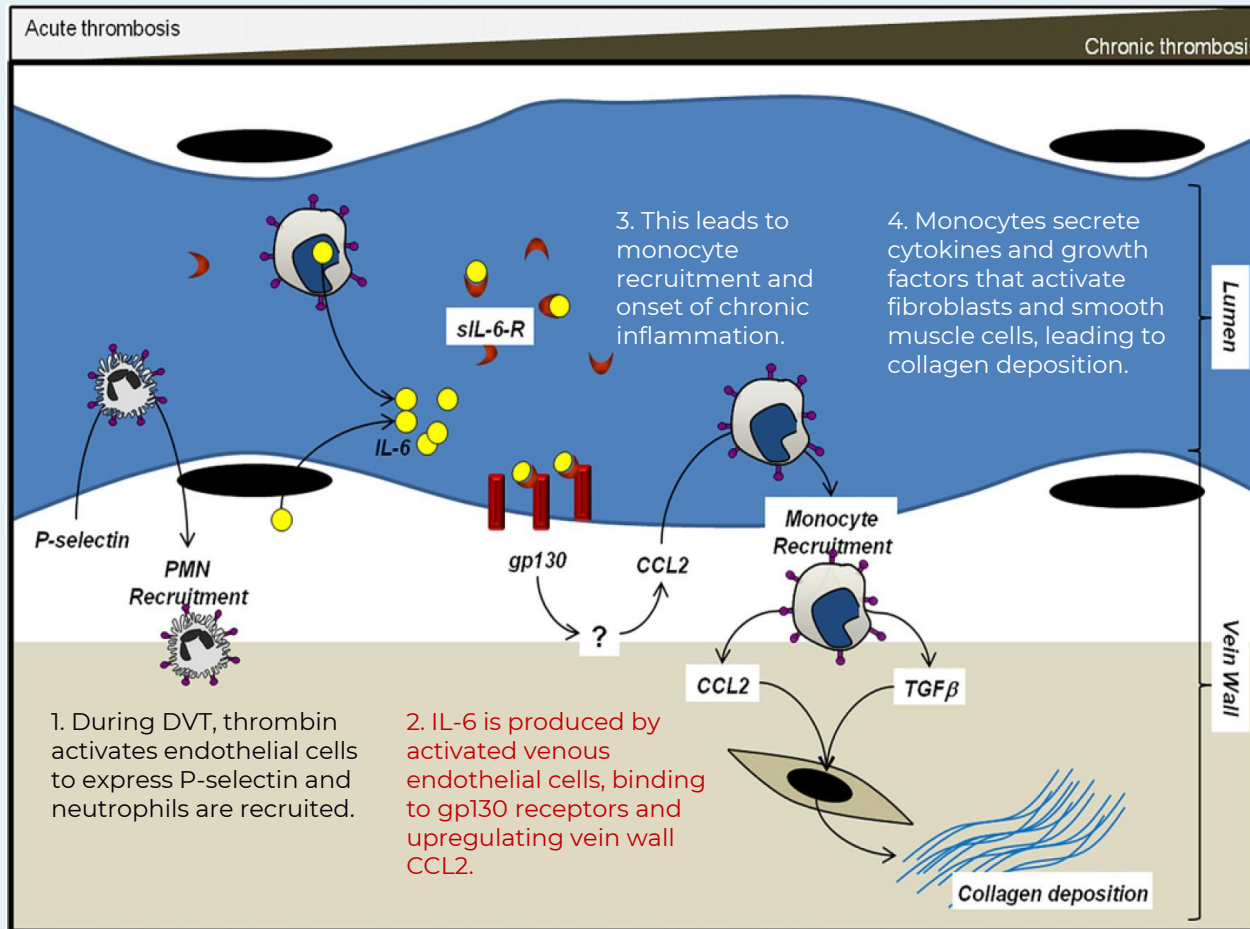

Treatment Characteristics	N (%)
Thrombolysis	8 (61.5%)
Thrombectomy	12 (92.3%)
Stenting	7 (53.8%)
Vein Length Targeted with Dexamethasone	35 \pm 12 cm
Dexamethasone Perivascular Dosage	46 \pm 15 mg

Extent of DVT by Participant:

DEXTERITY-AFP Early Biomarker Examination

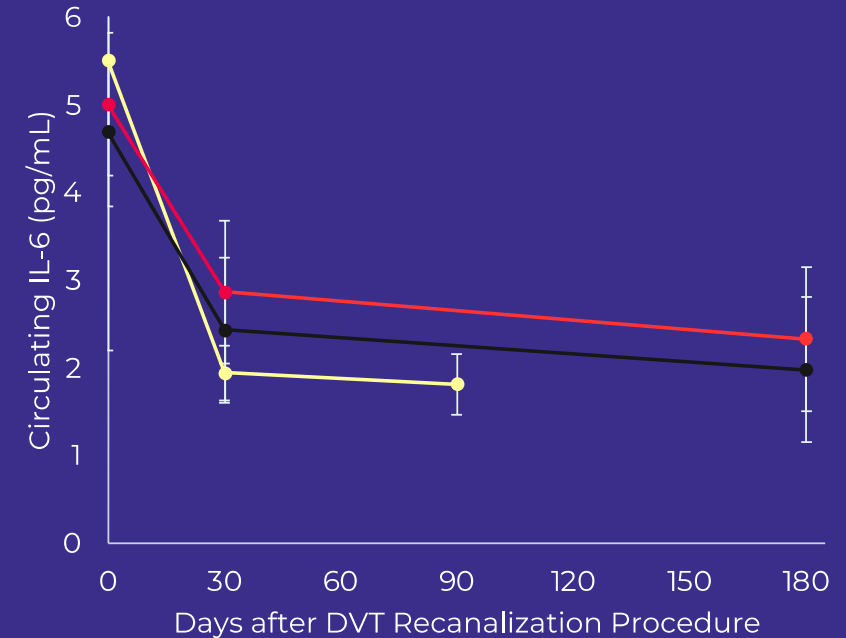

IL-6: An Upstream Inflammatory Marker

From Wojcik, et al. Ann Vasc Surg 2011;25:229-239.

DEXTERITY-AFP Biomarker Study: Interleukin-6 (IL-6)

(Compared to Rabinovich et al. J Thomb Haemost 2015;13:398-408; SOX study - 63% fempop)

- DEXTERITY-AFP (n=7)
- Post Thrombotic Syndrome (Rabinovich 2015, n=327)
- No Post Thrombotic Syndrome (Rabinovich 2015, n=347)

DEXTERITY-AFP Early Ultrasound Examination

**Normal vein:
Fully compressible (FC)**

**Thrombosed vein:
Non-compressible (NC)**

DEXTERITY-AFP Preliminary Data: 1-month DUS Compressibility

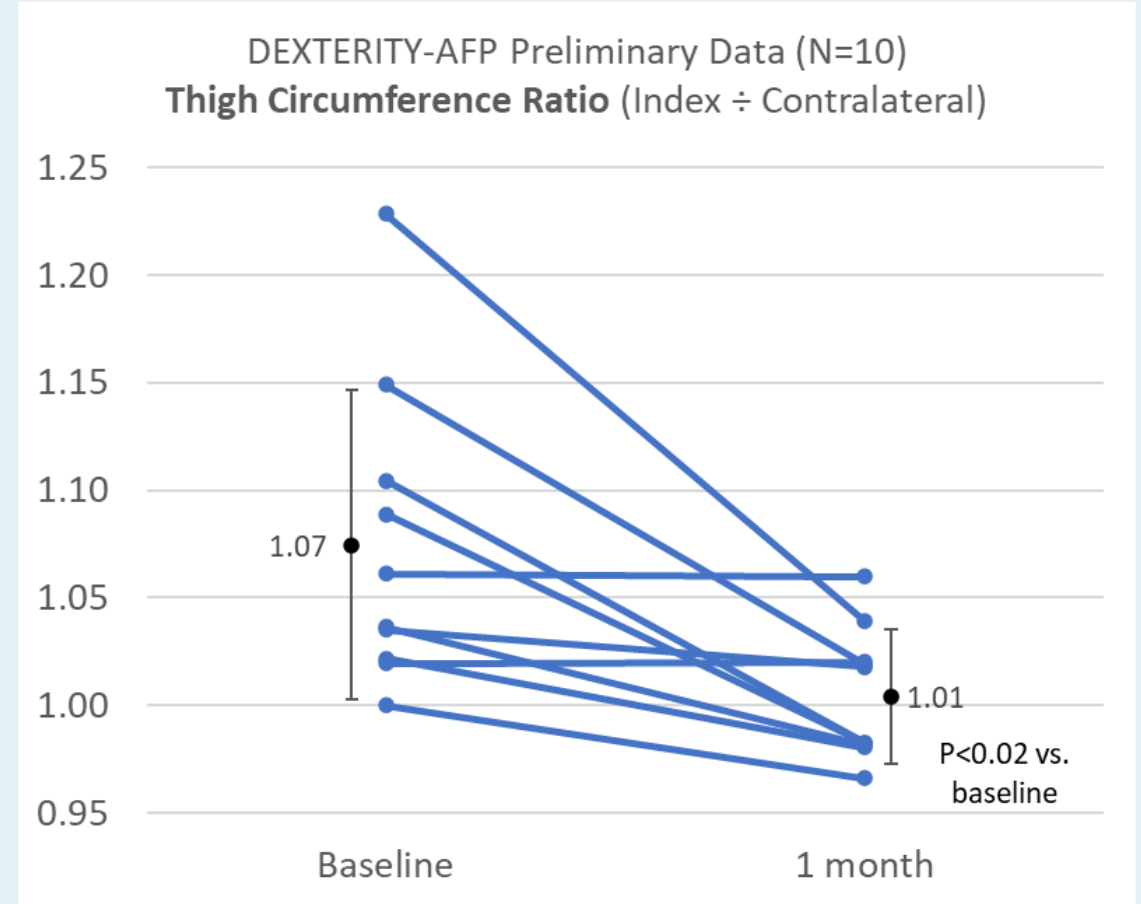

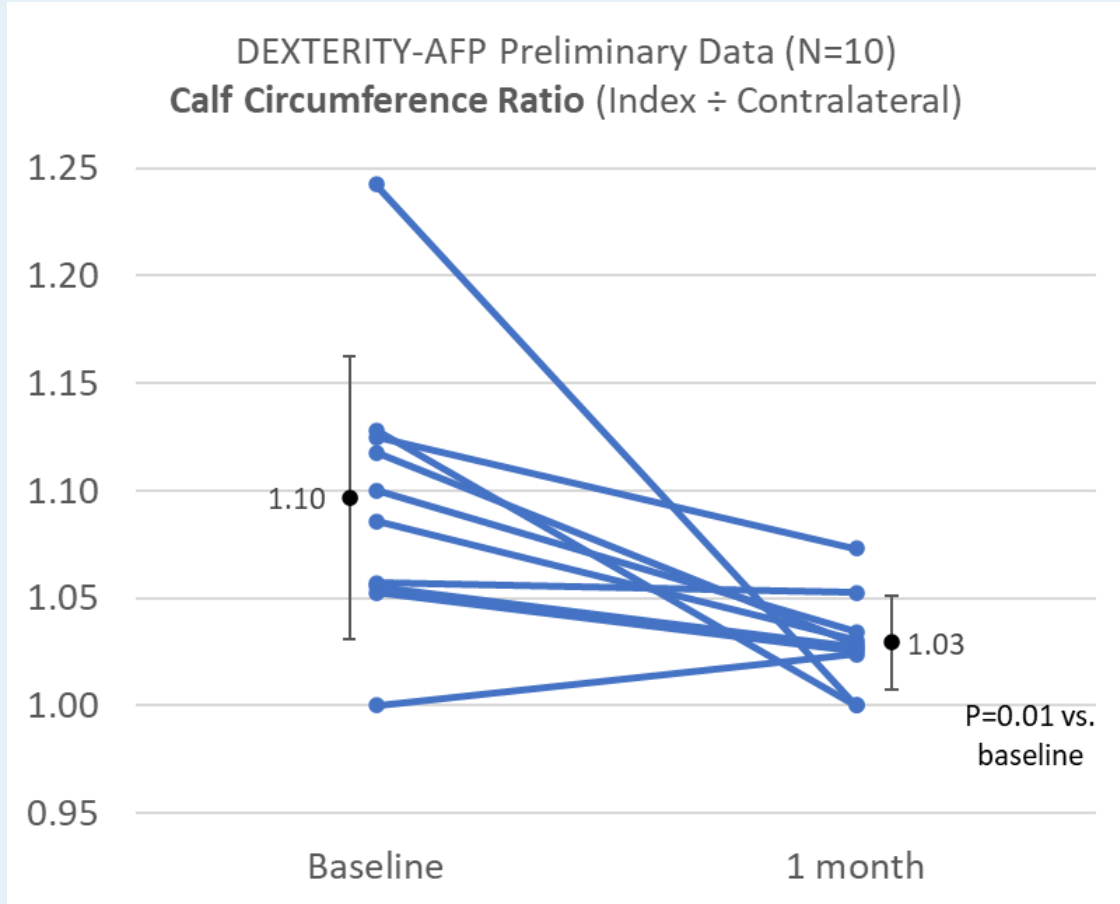

Non-compressibility of the CFV at 1 month is predictive of poor chronic outcomes*

Outcome	FC	NC	p-value
higher rates of any PTS at 2 years	46%	61%	p < 0.001
worse Quality of Life Score** at 2 years	81.4	73.2	p = 0.004
higher moderate-severe PTS at 2 years	19%	30%	p = 0.003

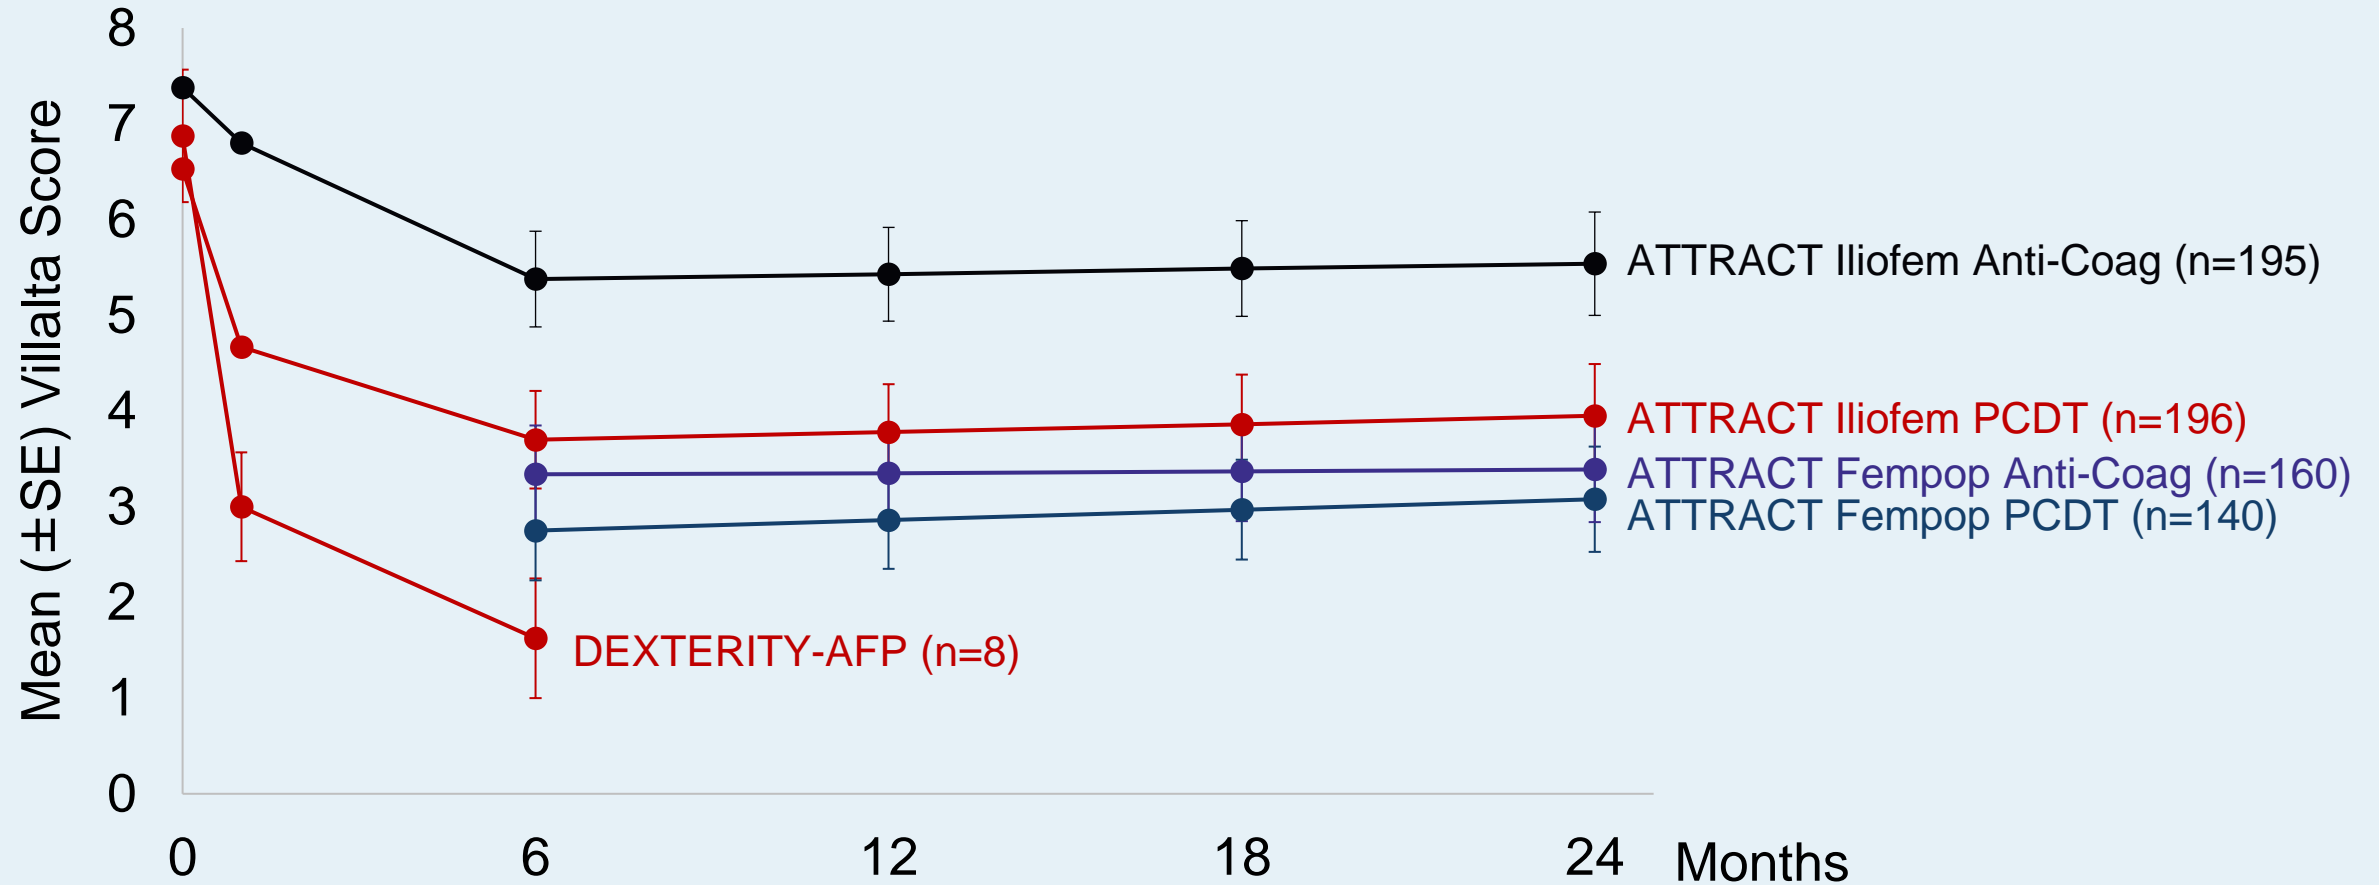

*Weinberg et al. Vasc Med. 2019 Oct;24(5):442-451

DEXTERITY-AFP Early Leg Circumference Examination

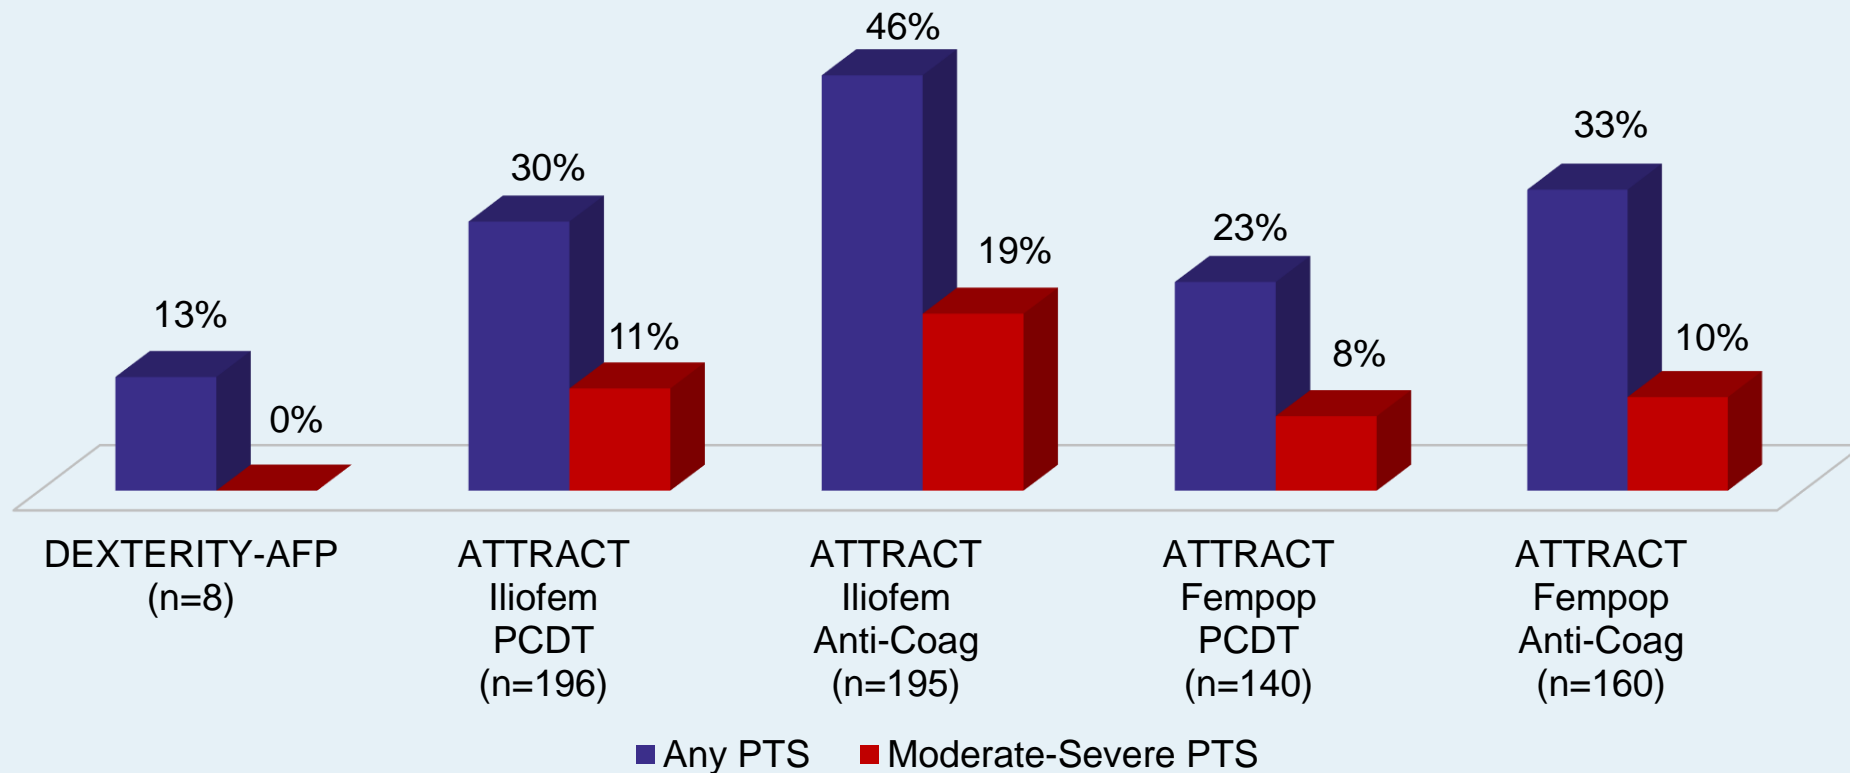

DEXTERITY-AFP Preliminary Villalta Score Examination

Mean Villalta Score (Quantity and Severity of Symptoms)

DEXTERITY-AFP Preliminary PTS Examination

6-month Post Thrombotic Syndrome (by Villalta Score)

Summary of Early DEXTERITY-AFP Outcomes

- DVT continues to have poor outcomes, and aggressive thrombus removal alone may not help
- The anti-inflammatory treatment of underlying venous inflammation is possible with localized perivascular drug delivery
- Dexamethasone in preclinical studies appears to normalize vein wall in the presence of DVT
- Preliminary biomarker, compressibility, and Villalta signals all appear promising from the initial participants enrolled in study

Interventional Management of Chronic Obstruction

Click to edit

IVC and Iliac Vein Obstruction

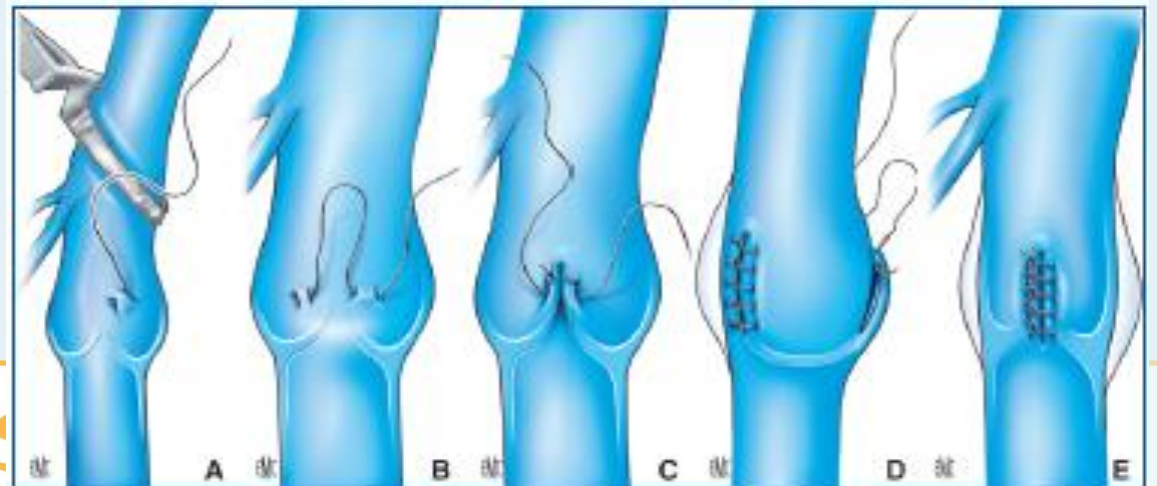

Current stents are useable from the CFV to the Terminal IVC

New Stents are being investigated for IVC obstruction

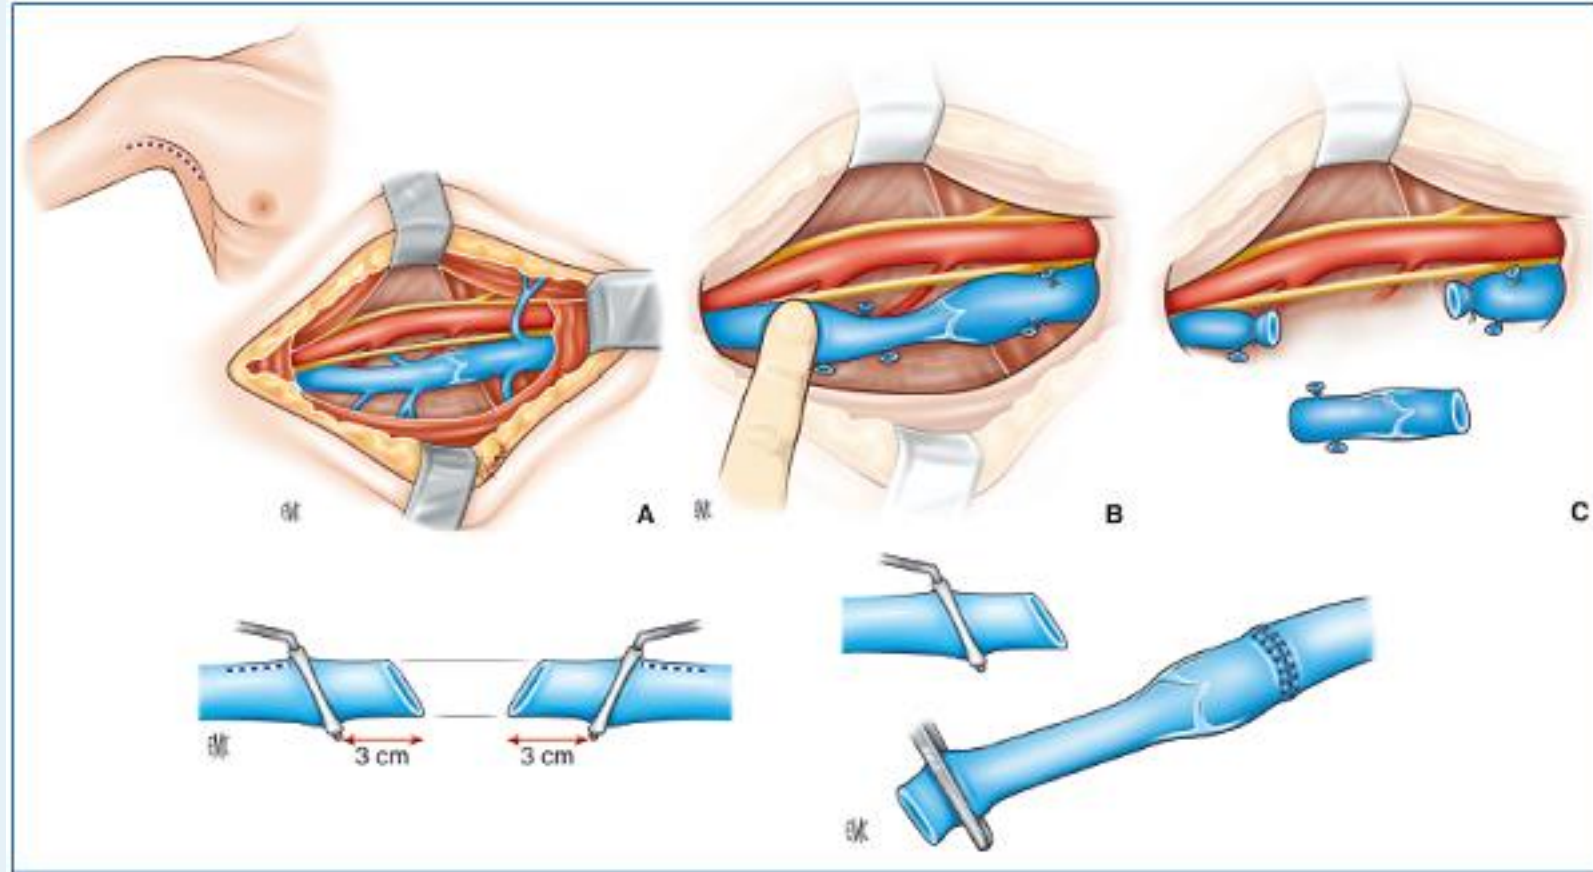

Can We Treat Reflux?

- The valve can be primarily repaired
- Kistner 1968 performed the first valvuloplasty
- In internal valvuloplasty, the vein is opened and the valve is identified under direct visual control
- In external valvuloplasty, the vein is repaired without opening

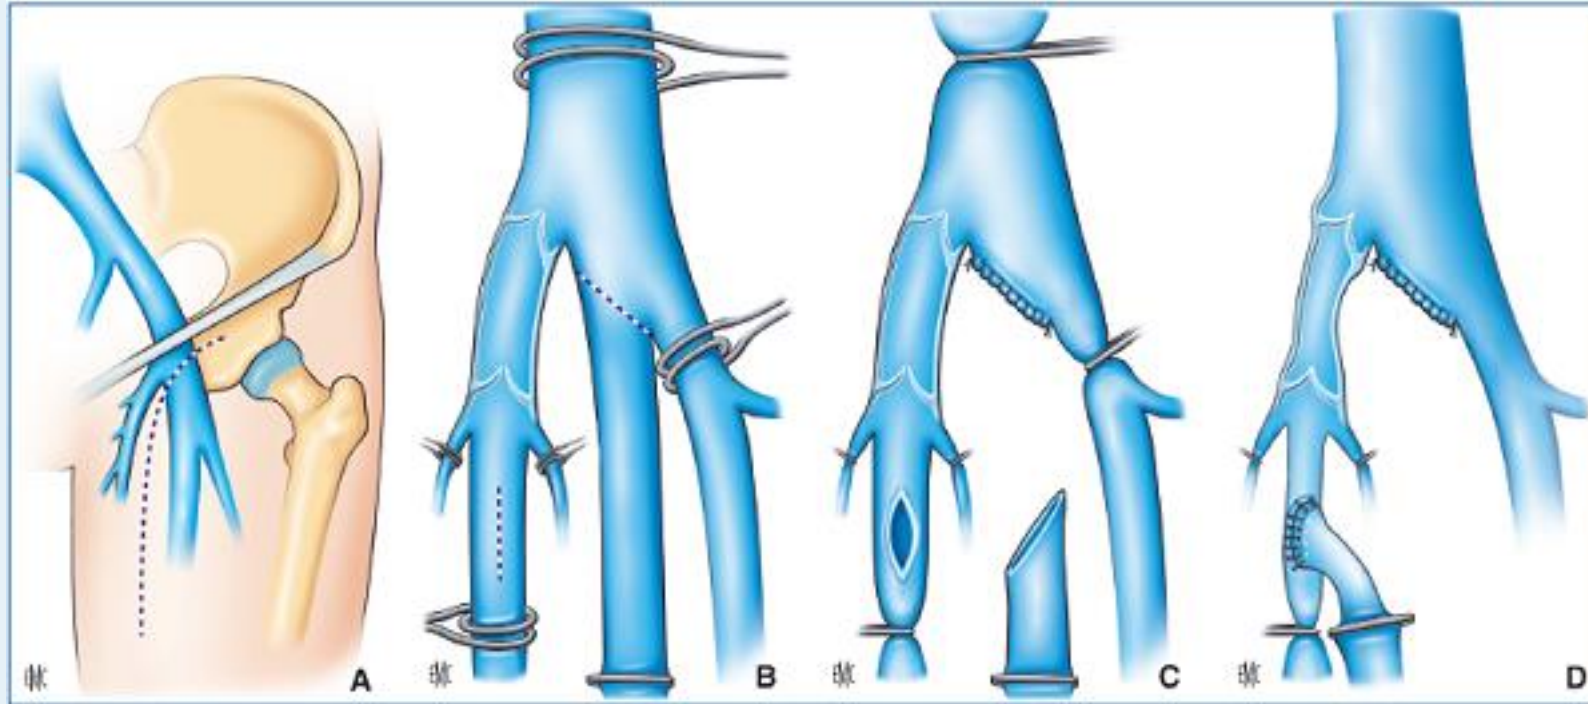

Venous Valvular Transplantation

- Transplantation of a venous valvular segment. In 1982, Taheri (USA) and Raju (USA) proposed using the humeral and axillary veins which have a functional valve and can be collected undamaged and transplanted into the lower limb

Venous Valve Transposition

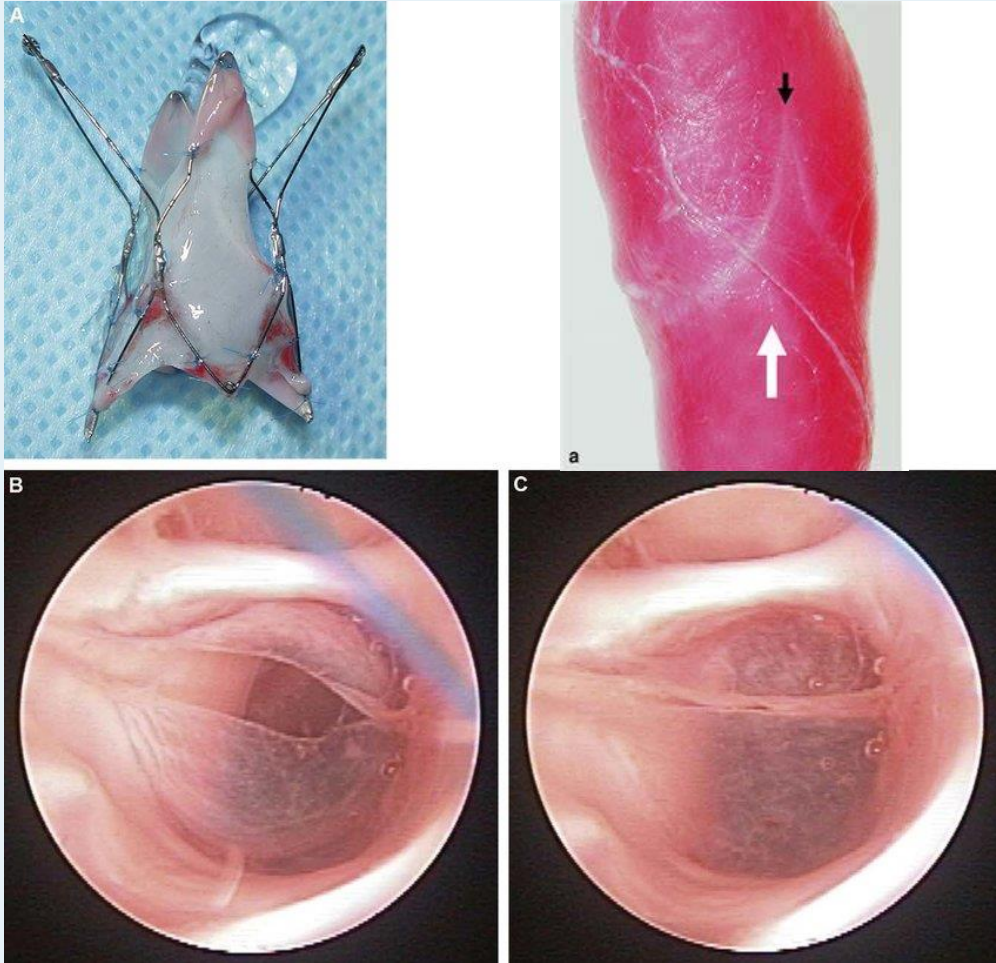

- Transposition consists of transposing the vein that is the site of reflux onto another lower limb vein, below its competent valve). R. Kistner (USA) invented this technique in 1982.

Neo-Valve Creation

- The creation of a neovalve using venous tissue from the patient was proposed by P. Plagnol (France) in 1999 and by O. Maleti – *After opening the vein a few centimeters along its axis, the operator divides its wall on one side into two layers.*
 - *This detachment stopped in the middle allows construction of a sac which corresponds to a valve in a normal subject.*
 - The same technique is performed on the other side thus creating a valve with 2 valvular cusps.*(Italy) in 2002.

Percutaneous Autologous Valve Transplant

- Percutaneous autologous venous valve transplantation. (A) The harvested autologous venous valve attached to a stent valve template. (B) Venoscopy of the transplanted valve specimen at 3 months. Bicuspid valve inside a flow model demonstrates thin leaflets in the open position and (C) closed position.

Overview of BlueLeaf and EVF (Endovenous Valve Formation)

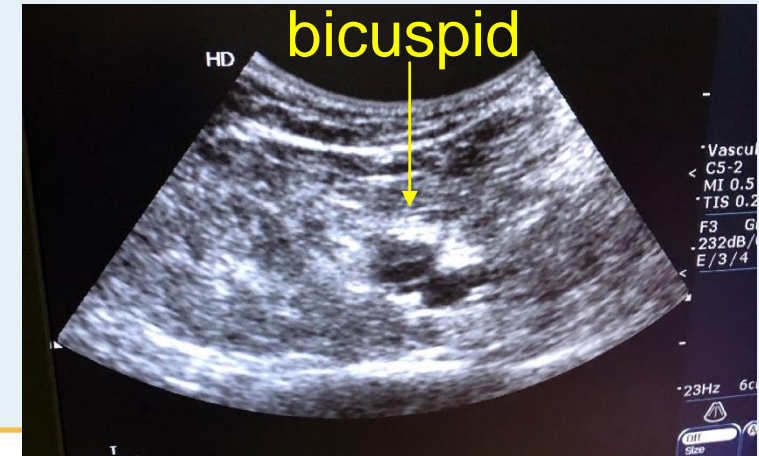

16 Fr Retrograde access, 1-3 autogenous valve pockets/stations with no implant in fem & pop vein

Cadaveric Monocuspid

Monocuspid & Bicuspid EVF Valves

Summary of Clinical Experience

- n=36 cases, F/U 30d - > 2yrs, 3rd Gen catheter config w/ongoing improvement in procedure and peri-op valve formation, quality
- Favorable safety w/single asymptomatic DVT (<3%) @ discharge
 - Recanalized by 30 day f/u w/out intervention or change to meds, post-Op mgt
 - Few AE/complications, typical interventional & co-morbidity types
 - Very few adverse late issues to report
- Favorable clin improvement in VCSS as well as pain reduction via VAS
- First bicuspid valves (n= 11 pats) by 5 physicians, FDA recently authorized use in US EFS
- US EFS IDE completed n= 13 of 20 cases w/92% technical success rate, *Rec'd Breakthrough Device Designation, use of Bicuspid in EFS Dec 21*
- *Gained experience re; procedure improvement/techniques, post-op valve imaging, hemodynamics, training, patient selection*

enVVeno

- Venous Valve Implantation
- FDA granted IDE approval to assess the safety and efficacy of the VenoValve for the treatment of patients with deep venous valvular insufficiency
- Prospective, non-blinded, single-arm, multi-center study
- 20 U.S. investigational sites
- 75 patient study
- CEAP Score: C4b – C6 patients

SAAVE Trial Outcomes

Total Enrollment (n=75)

Overall Reporting Cohort (n=69)

(2 technical failures, 4 patients exited the study)

**Clinical Improvement Cohort
(n=65 of 69) (≥ 1 Improvement rVCSS)**

- 24 months (n=9)
- 12 months (n=31)
- 6 months (n=29)

65 Patients
762 Months – Total Patient Follow-up
11.04 Months – Average Patient Follow-up

**Clinical Meaningful Benefit Cohort
(n=50 of 69) (≥ 3 point improvement rVCSS)**

- 24 months (n=7)
- 12 months (n=26)
- 6 months (n=17)

50 Patients
582 Months – Total Patient Follow-up
11.64 Months – Average Patient Follow-up

Conclusions

- We can do better in the prevention and treatment of PTS
- New Technology will allow more efficient thrombectomy and lower rates of PTS
- Newer Stents will allow for the treatment of IVC obstruction rather than just iliac obstruction
- The addition of anti-inflammatory agents is a promising technology to prevent early venous inflammation and reduce the rates of PTS
- Treatments for Deep Venous Reflux continue to evolve

Thank You
